

Installing Java On a MAC

For those people who use a Macintosh, the easiest way to install/upgrade the Java Run Time client is to use the built-in software update feature.

Java for Apple

Apple Computer supplies their own version of Java. Use the [Software Update](#) feature (available on the Apple menu) to check that you have the most up-to-date version of Java for your Mac.

If you have problems with downloading, installing or using Java on Mac, please contact Apple Computer Technical Support.
